VERITAS™ Backup Exec 9.0 for Windows Servers

AGENTS & OPTIONS

Backup Exec is designed to provide high performance, reliable Windows Server data protection. A complete family of powerful agents and options expand Backup Exec's storage management tools to meet diverse application needs for growing and upgrading storage management capabilities.

KEY BENEFITS

- Greater granularity and faster recovery of specific application or file system information
- Seamless integration with Backup Exec simplifies management and enhances reliability
- Scalability to deploy storage solutions as networks and storage needs expand

OPTION GROUPS

Media Server Options

Exercise greater control of storage resources and alternate backup techniques

Remote Client Access Options

Connect and protect remote Microsoft Windows and Novell NetWare servers on the network

Online Groupware Agents

Non-disruptive protection for corporate e-mail messaging and knowledgebase applications

Online Database Agents

Protect and recover mission-critical database applications

Disaster Recovery Options

Total recovery of local or remote systems

Storage Options

Used for expanding to larger media storage devices or sharing storage resources over a SAN

MEDIA SERVER OPTIONS

NEW! Admin Plus Pack Option

Exercise greater control of remote Backup Exec servers on the network with components designed to ease management of distributed backup servers. Features include the ability to clone and remotely install media servers as well as copy jobs, selection lists and job templates between media servers. This option provides an additional 24 management reports and advanced capabilities such as report scheduling and e-mailing output to recipients.

ENHANCED! Advanced Open File Option*

Ensure that files on local or remote servers are protected even while in use. The VERITAS Backup Exec Advanced Open File Option handles open files at the volume level and is seamlessly integrated into Backup Exec. There is no need to know which files are open ahead of time; just set a scheduled backup to use this option with a simple mouse click. Advanced technology also integrates the ability to detect and leverage alternate frozen image technologies such as Microsoft Volume Snapshot Service (VSS) on Windows Servers 2003 or VERITAS Volume Manager FlashSnap for increased application availability.

Intelligent Image Option*

An ideal solution for servers with thousands of small files requiring fast backups with minimal impact to system resources – such as a Web server, it increases backup performance and reduces CPU processes by mapping the meta-data of a local/remote file system and writing the volume as a single file. It seamlessly integrates into Backup Exec operations and allows full volume or individual file restores from full, incremental and differential backups.

REMOTE CLIENT ACCESS OPTIONS

Remote Agent Client Access License (CAL) for Windows Servers

Expand network-wide data protection and optimize data transfers for remote Windows servers, including local Registry and System State information. Exclusive Agent Accelerator™ technology maximizes backup and recovery performance by providing

source-level compression and distributed processing at the client. The result is reduced network traffic and maximized data throughput.

Remote Agent Client Access License (CAL) for NetWare Servers

Incorporate remote NetWare server data protection and recovery into daily backup and recovery activities. This agent offers 100 percent SMS compatibility and NDS bindery information for NetWare servers. Exclusive Agent Accelerator technology maximizes backup and recovery performance by providing source-level compression and distributed processing to reduce network traffic and maximize throughput.

ONLINE GROUPWARE AGENTS

Agent for Microsoft Exchange Server*

Fast, flexible technology to protect vital Exchange Server 5.5 and 2000 data while the application is online. This agent provides full or incremental, or differential backup and restores of all Exchange Server components- including embedded objects, attributes and all Outlook components. The Agent for Microsoft Exchange Server gives administrators the flexibility to perform full, incremental or differential individual mailbox backup with selective restores of individual public folders. Using the Single Instance Storage feature eliminates backup of duplicate information by storing only the first instance of attachments distributed to multiple mailboxes. The agent for Exchange also enables automatic recreation of a mailbox and user account during restore -- allowing administrators to easily manage backup and expedite recovery of data, while consuming less network, system and media resources.

Agent for Microsoft SharePoint Portal Server*

Safeguard a SharePoint Portal Server corporate knowledgebase system with online, fast and reliable data protection and recovery. Now offers additional granularity to perform backup and restore of individual SharePoint Portal Server workspaces and documents for greater flexibility and faster performance. Protected portal components include the Web Storage System, Search Service, server configuration files and the Applications folders. Restore options include a full database and dependent data restores or redirection to an alternate SharePoint Portal Server.

Agent for Lotus Domino*

Integrate comprehensive data protection of vital Lotus Domino 5 and 6 messaging and collaboration databases within daily backup activities. Using the native Domino backup API, this option integrates non-disruptive data protection of the databases and transaction logs. Flexible restore options include database redirection and point-in-time "roll-back" recovery of databases or transaction logs. Users also benefit from user-controlled recycling of the transaction logs reducing manual intervention and speeding recovery.

ONLINE DATABASE AGENTS

Agent for Microsoft SQL Server*

Ensure business-critical databases and e-business data are protected in the event of application-or hardware-based corruption or loss. This agent provides SQL Server 7.0 and 2000 users granular protection down to the individual database or filegroup. Execute differential backups as well as Transaction Log backups with automatic truncation. Restore with One-Pass recovery of the last full and any subsequent backup as a single restore job or perform "rollback restores," enabling a database to be recovered to a specific moment in time, rather than a specific restore point based on the last backup job. Multi-pipe and Virtual Device Interface (VDI) support give users the most dependable and fastest method available for complete SQL Server protection.

Agent for Oracle*

Integrate non-disruptive data protection for business-critical Oracle Server 9i, 8i, and 8.x applications and databases. Use advanced features such as the granular protection of individual table spaces or a complete application/database backup and the protection of archived redo logs and control files, without ever taking them offline.

Agent for R/3 for Oracle*

Provide certified data protection for business-critical SAP applications while the application is still online and in use. The Agent for R/3, is a reliable solution that allows Backup Exec to provide both local and remote protection of the latest versions of R/3 databases using the SAP (BC-BRI BACKINT) interface for efficient data management.

DISASTER RECOVERY OPTIONS

Intelligent Disaster Recovery™ Option

Implement a server recovery solution for both local and remote Windows servers, eliminating the need to first reload the entire operating system of crashed servers. Using either diskette-based, CD-R/CD-RW or bootable tape, Intelligent Disaster Recovery will quickly recover downed servers enabling restores from the last complete backup set including full, differential, incremental, and working set backups. The Intelligent Disaster Recovery Option integrates directly with Microsoft's Automated System Recovery (ASR) functionality in Windows Server 2003 and Windows XP to provide complete disaster recovery on Windows servers.

STORAGE OPTIONS

Library Expansion Option

Scale the media storage system by leveraging additional drives within multi-drive tape or optical autoloader/library storage systems. This option's Advanced Device and Media Management (ADAMM) technology provides extensive configuration and management capabilities to include "lights-out" backup and restore operations, bar-code reader and portal support for both SCSI- and Fibre-attached devices. Users can partition autoloader slots to target backup jobs to a specific slot.

SAN Shared Storage Option

This powerful LAN-free backup solution allows multiple distributed backup servers to centralize storage devices that are connected over a switched fabric storage area network (SAN) for greater performance, efficiency and fault tolerance. SAN Shared Storage Option load balances job activity across shared devices from multiple Backup Exec servers. The resulting increase in performance and backup speeds and centralized management of media lowers the total cost of ownership. SAN Shared Storage Option is a groundbreaking solution in manageability and performance for large-scale, high-end storage environments.

Tivoli Storage Manager Option

Access the full line of IBM midrange or mainframe hardware and Tivoli Storage Manager software to leverage the system as a large data storage device. With this option, backup data is routed to the Tivoli system just as if it were a large tape library or autoloader. Additional access clients are available providing greater flexibility for multiple backup servers access to the Tivoli architecture.

*These options include a Remote Agent (CAL) for Windows Servers
